The DERO system as the external stabiliser in treatment of instabilised compressed of radius fracture in distal part.

(System DERO jako stabilizator zewnętrzny w leczeniu zmiążdżeniowego, niestabilnego złamania części dalszej kości promieniowej)

Summary. Open reposition or reposition and external stabilisation are the method of choice in cure of comminutive and compressed fracture of radius in distal part. The goal of our work is to present possibilities of the DERO system as an external stabiliser. We used the specially

prepared rod-plate called DERO G-2 in the treatment of 3 patients. The application of the new method allowed precise reposition and good stabilisation of the bone fracture and healing up of the bone with regaining of the full function of the hand.
